

Group Power Capping experiment

step 1: Configure Power Provision in GUI

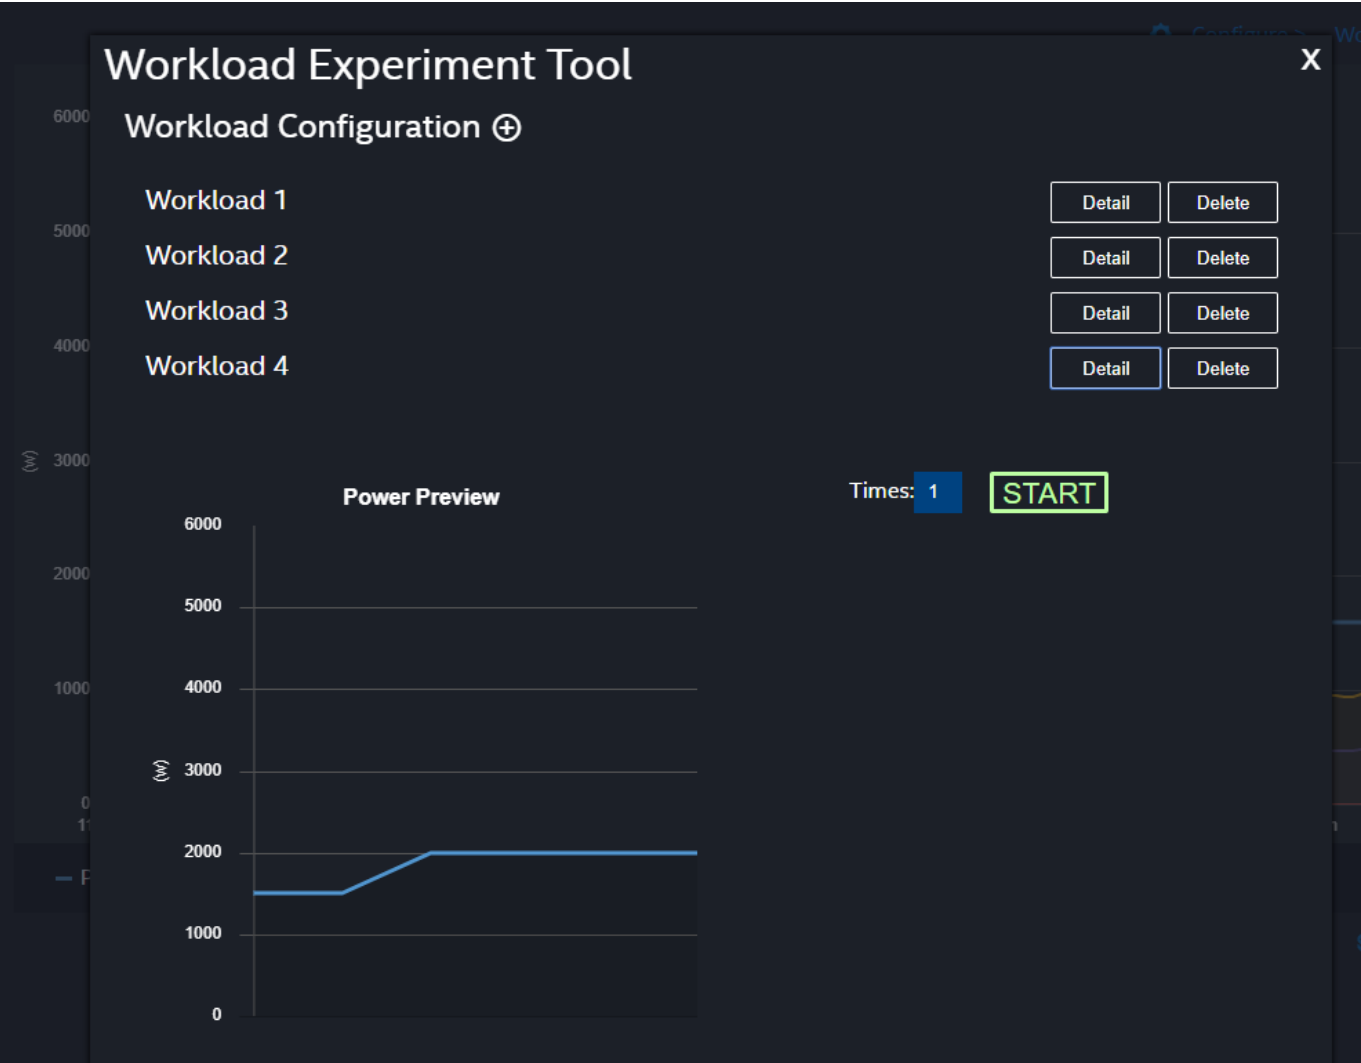

step 2: Create Experiment Power Line

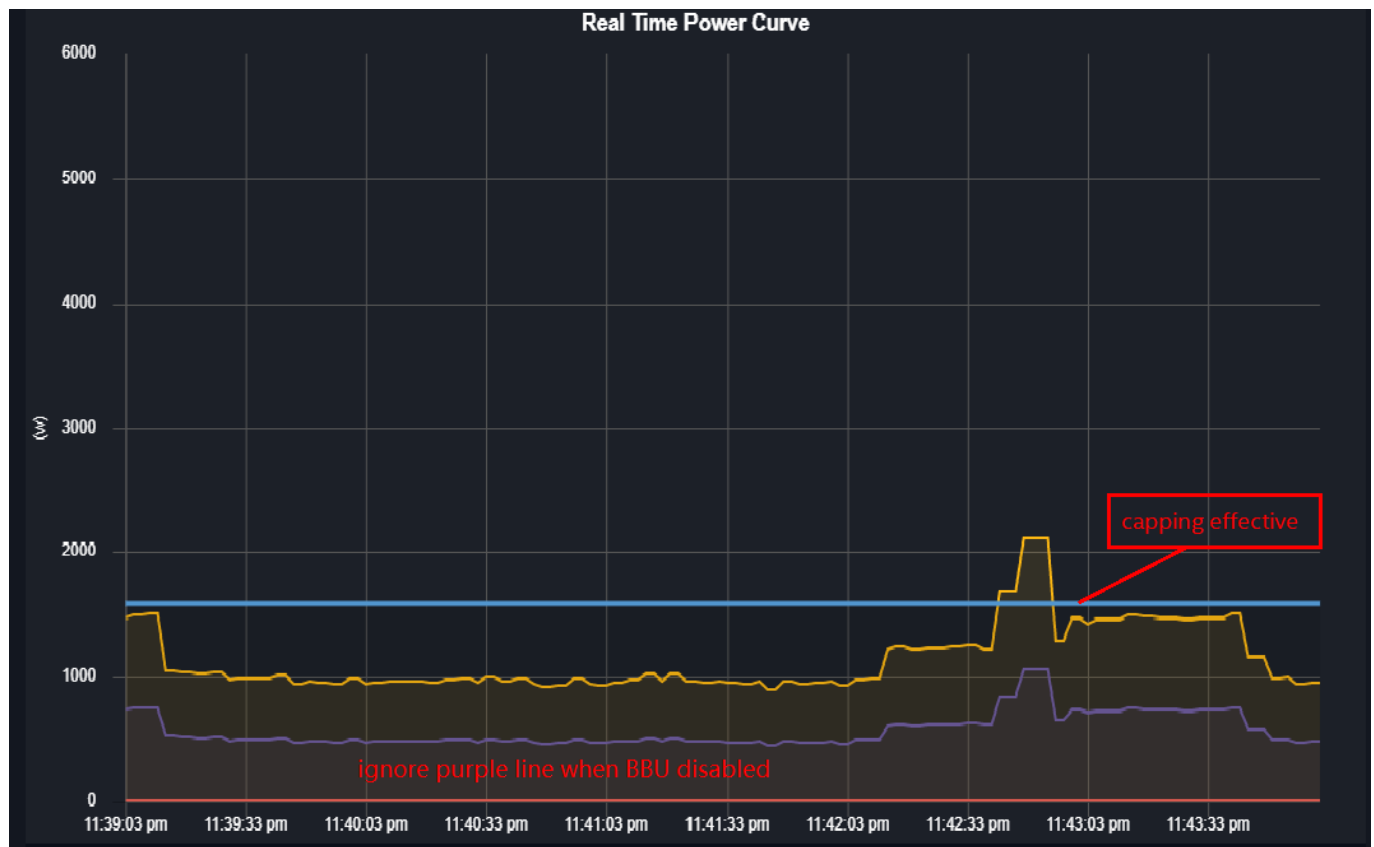

We can design a power line or use history data for experiment. Inteval means the time gap between the workload change.

step 3: Start Workload

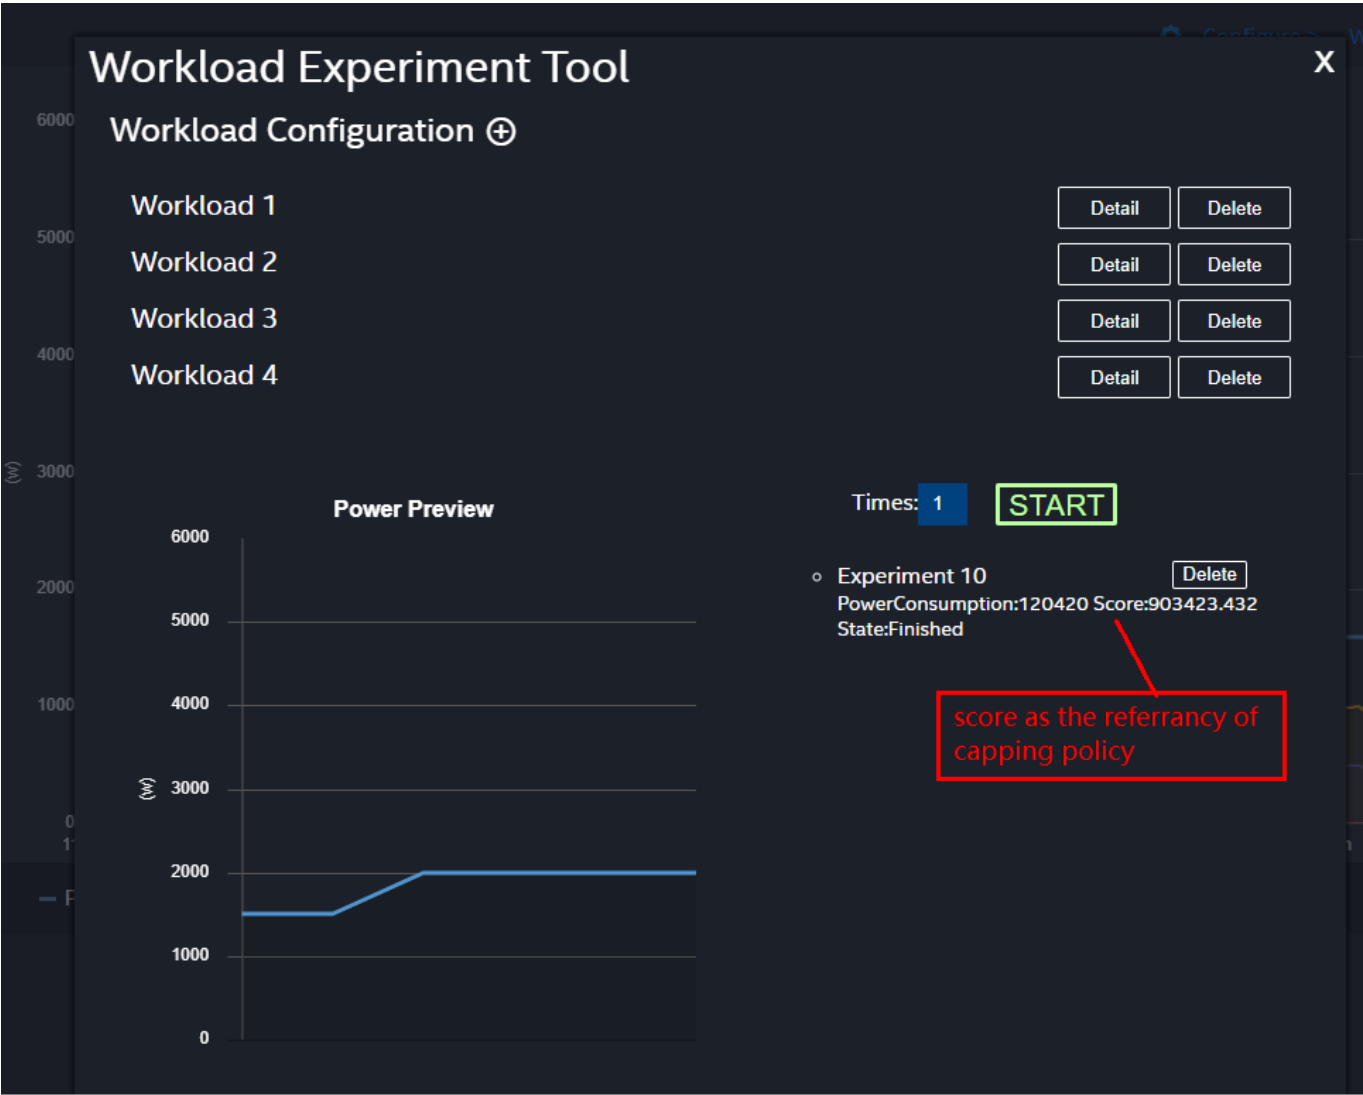

step 4: Check Power Management Behaviour in GUI

step 5: Read the Report in GUI

We can get power consumption performance score of the experiment.

Different Capping Policy Comparison

we can run the experiment with different capping policy to observe different power line behavior and the report just as follows:
